

Integrated Wastewater Information Management System (IWIMS®)

Custom Data Solutions for Community Wastewater Management

Stone Environmental Inc.'s Integrated Wastewater Information Management System (IWIMS®) manages onsite wastewater information for the efficient administration of permits, scheduling and follow-up of operation and maintenance, and fulfillment of performance monitoring requirements.

A powerful component of Stone's wastewater management services, IWIMS is as easy to use as an Internet browser. It's a flexible system that can be customized to reflect the changing needs of growing communities.

IWIMS® is:

Online. Users access IWIMS with ordinary browser windows.

User Friendly. IWIMS makes it easy for government agencies, utilities, and system managers to organize, store, and retrieve their onsite system and environmental information.

Smart. IWIMS tracks and coordinates information about onsite wastewater treatment using a relational database application. This enables users to access information quickly and create powerful reports.

Comprehensive. IWIMS is a data warehouse containing links to GIS data and information on permits, system components, site characteristics, as-built drawings, compliance, inspections, maintenance, monitoring wells, and groundwater quality.

Web Based. IWIMS is accessed from a standard computer using Internet Explorer. Its menus and certain data items are hyperlinked, so you can move through the program vertically (drilling down into the database for more detailed information) and horizontally (linking from one section to another without retracing every step) as you collect, add, or review the data.

Scalable. It can handle one system or thousands of systems and their associated records.

Role Based. Different users can have different levels of access and authority.

Custom Fit. Our flexible design allows for easy, cost-effective customization for each organization or community.

Secure. Each client's information is completely secure and available to that client only.

Affordable. In addition to managing their onsite systems, communities could use IWIMS to manage and track user fees to fund the purchase of and ongoing support for IWIMS and its administration.

About Stone Environmental, Inc.

Stone has an international reputation for solving difficult wastewater management problems. We specialize in decentralized and integrated (onsite/cluster/sewer) solutions for communities willing to question the conventional assumption that new or expanded sewers are the only solution.

Over the years, Stone has worked with dozens of US communities, from Martha's Vineyard on the Atlantic coast to Malibu on the Pacific, and advised state and national officials on decentralized policy development. We've also worked internationally—in Indonesia, Bulgaria, Australia, and the West Bank.

Our services include comprehensive needs assessments, feasibility studies, and wastewater management planning. We welcome inquiries.
