What is Stone doing to support sustainable outcomes in agriculture?

Farm Phosphorus Reduction Planner (Farm-PREP)

A web-based tool developed by Stone Environmental to incentivize management that improves adoption of conservation practices in Vermont, recently enhanced with additional sustainability-focused metrics.

Farm-PREP runs APEX model simulations designed to assess the impacts of long-term agronomic management at field and farm scales.

The logo for Farm-PREP, with 'FARMP' in dark green and 'REP' in a lighter green.

Agricultural Policy/Environmental eXtender Model (APEX)

A USDA supported field to small watershed scale model that simulates water, sediment, nutrient, and pesticide transport from fields, as well as crop growth, biomass, yields, carbon/nutrient cycling.

Primary drivers are weather, physical characteristics of fields, and agronomic management.

The logo for APEX, featuring the letters 'APEX' in blue and a stylized 'X' composed of four colored diamonds (blue, green, green, brown). Below the logo is the text 'Agricultural Policy Environmental eXtender model'.

Presentation Outline

1

Background

Tool background, programmatic implementation

2

Tool Development

Customization for Vermont Agency of Agriculture, Food, and Markets, public access, data entry, assessment framework

3

Model Development

Multi-objective calibration, evaluation of management scenarios

4

Case Study

Field and farm scale results, scenario comparison in the tool

5

Take Aways

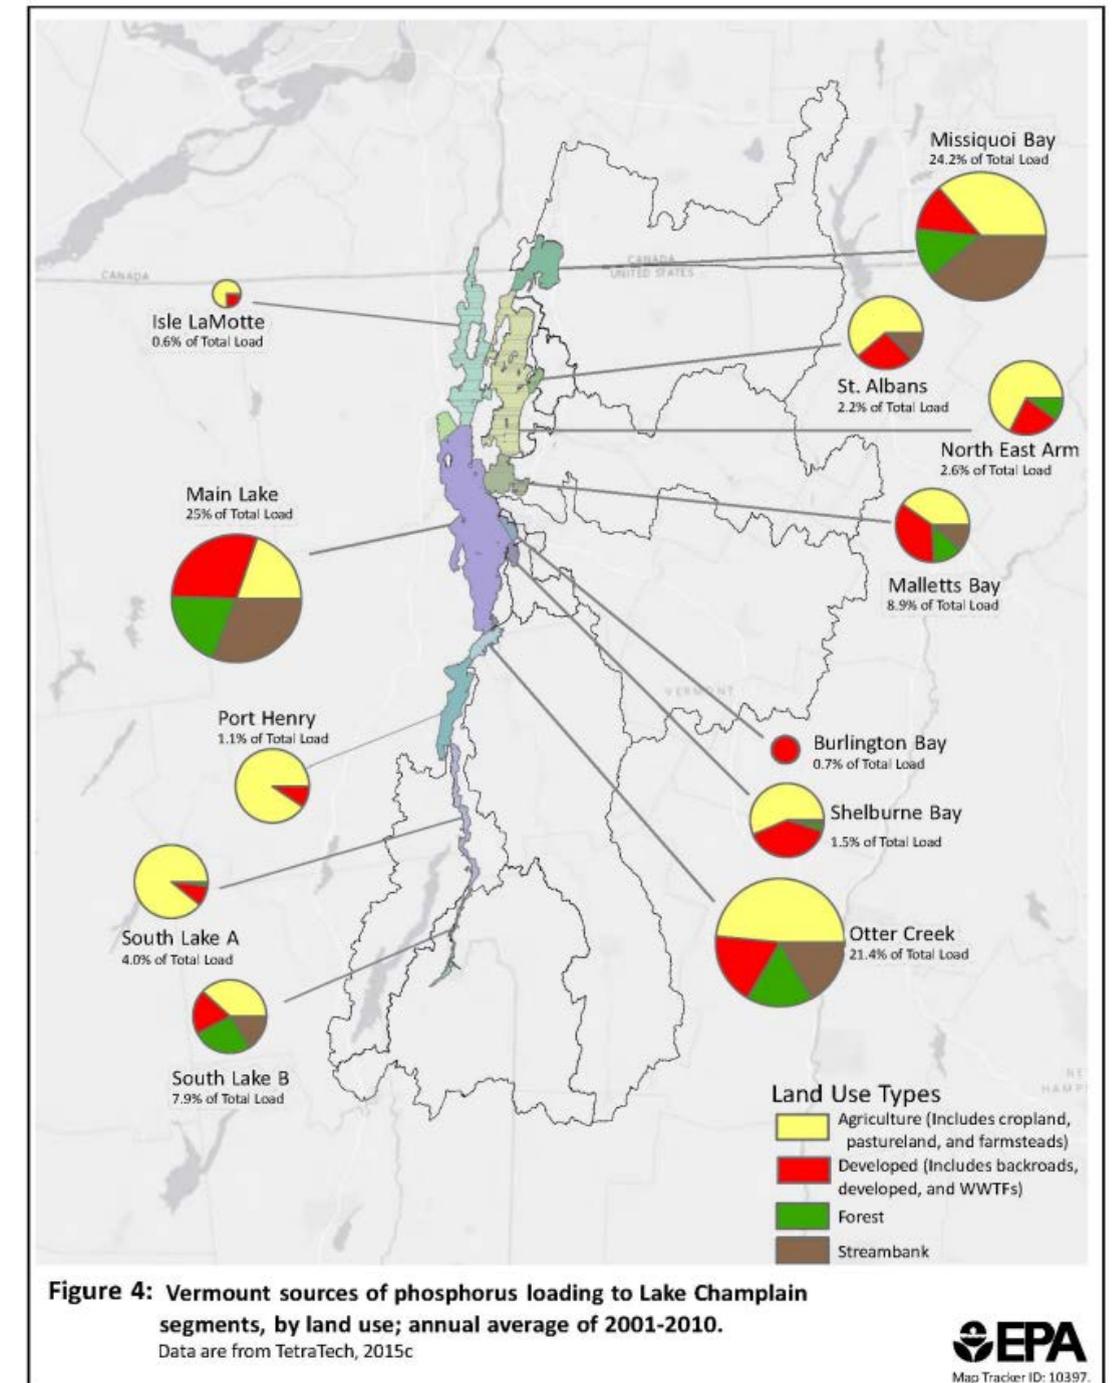

Implementation of this work, potential avenues for future development

Background: Farm-PREP

In Vermont, agriculture contributes significant amounts of phosphorus (P) to our surface water bodies and is the primary contaminant of concern in the Lake Champlain Basin (LCB). Farm-PREP was originally developed to help LCB reach TMDL goals for phosphorus.

Collaborators and Funders:

- Vermont Agency of Agriculture, Food, and Markets (VAAFM)
- National Resource Conservation Service
- Lake Champlain Basin Program / New England Interstate Water Pollution Control Commission
- University of Vermont Extension
- University of Vermont Researchers
- Newtrient

Background: Farm-PREP (2)

Key components of the tool framework include:

- Customized web-based user interface
 - Streamlined data entry
 - User specific
 - User role-based functionality
- Secure backend database including thousands of options for agronomic management representative of common practices in Vermont
- Dynamic, on-the-fly APEX simulations
- Multiple types of assessments (comprised of many APEX simulations)
- Field and farm-level model analysis and reporting

The screenshot displays the Farm-PREP web application interface. At the top, the logo "FARM-PREP" is visible with a "DEV" watermark. The user is logged in as "jstryker" and can access "CHANGE PASSWORD", "ABOUT FARM-PREP", and "LOGOUT" options. A search bar for "Find a place or address" is present.

The "Field List" section includes "Upload Fields" and "Draw Field" buttons. A text box states: "All fields must be added before running an assessment. All crop and hay fields managed by the farm must be added for assessment for VPPF. Field shapefiles can be uploaded or drawn directly in FarmPREP. Field names must be unique and exactly match the field names of any data to be imported, i.e. field shapefiles or soil tests."

Field	Acres	Soil Name	Hydro Group	Slope	Proximate to Water	
Apartment Pasture	0.3	Farmington	D	2.5	✓	🔍 🗑️
Back Corner	0.6	Vergennes	D	5.1	✓	🔍 🗑️
Back Paddocks	1.3	Vergennes	D	4.3	✓	🔍 🗑️
Behind Pond	1.1	Vergennes	D	4.7	□	🔍 🗑️
Big Field	3.4	Vergennes	D	3.2	□	🔍 🗑️

The "Assessments" section includes a "Hint" tab and a "Create new assessment" dropdown with an "Add" button. Below is an "Alternative Management" table:

Assessment Name	Assessment Type	P Target	Reduction	Status	Action
Demo	Alternative Practices			Incomplete	Edit Delete
Demo Opt	Alternative Optimization	50%		Ready	Edit Delete
Optimize_JS1	Alternative Optimization	35%		Complete	Results Edit

The right side of the interface shows an aerial map of a farm with several fields outlined and labeled: "Back Corner", "Wet Field", "Front Field", "Behind Pond", "Back Paddocks", "Apartment Pasture", and "Big Field". A scale bar indicates 40m and 100ft. The map is powered by VCGI, Microsoft, Vantor, and County of Chittenden, Esri.

Background: Vermont Pay for Performance

For the last 5 years, Farm-PREP has been used in support of the Vermont Pay for Performance program, goals of which were:

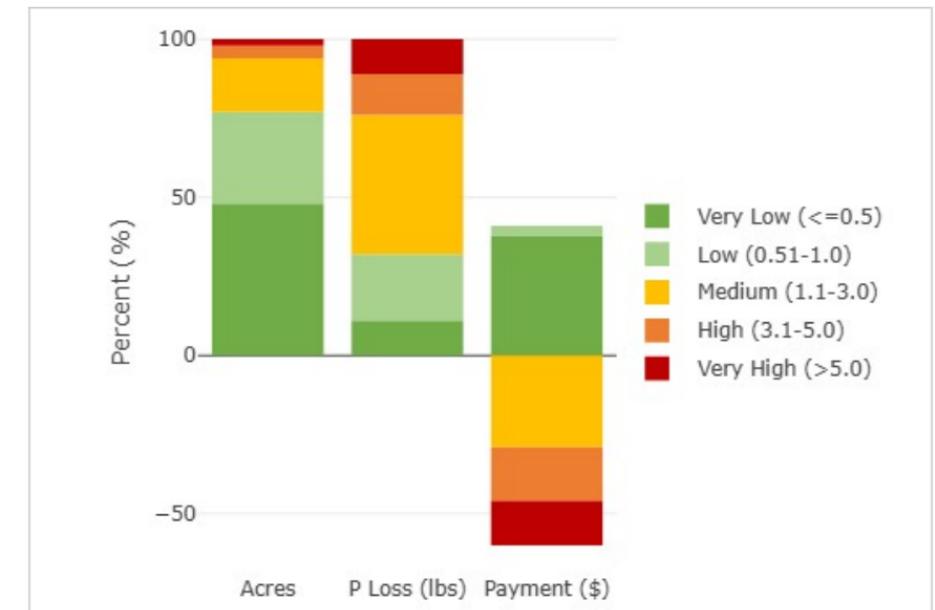

- Reduce **phosphorus** loss from agricultural fields to meet phosphorus TMDLs and state water quality goals
- Increase farmer buy-in by allowing farmers to decide what practices to implement on their fields
- Produce verifiable, measurable, location-specific outcomes
- Incentivize stewardship
- Provide sufficient and equitable payments to farms

VAAFM uses Farm-PREP to execute field-specific APEX modeling of current and baseline management for cropland and pasture fields.

- Predicts relative changes in runoff, erosion, and phosphorus loss
- Calculates payments (performance and stewardship) based on APEX predictions
- Customized reporting to show what fields contribute to payments or lack of payments

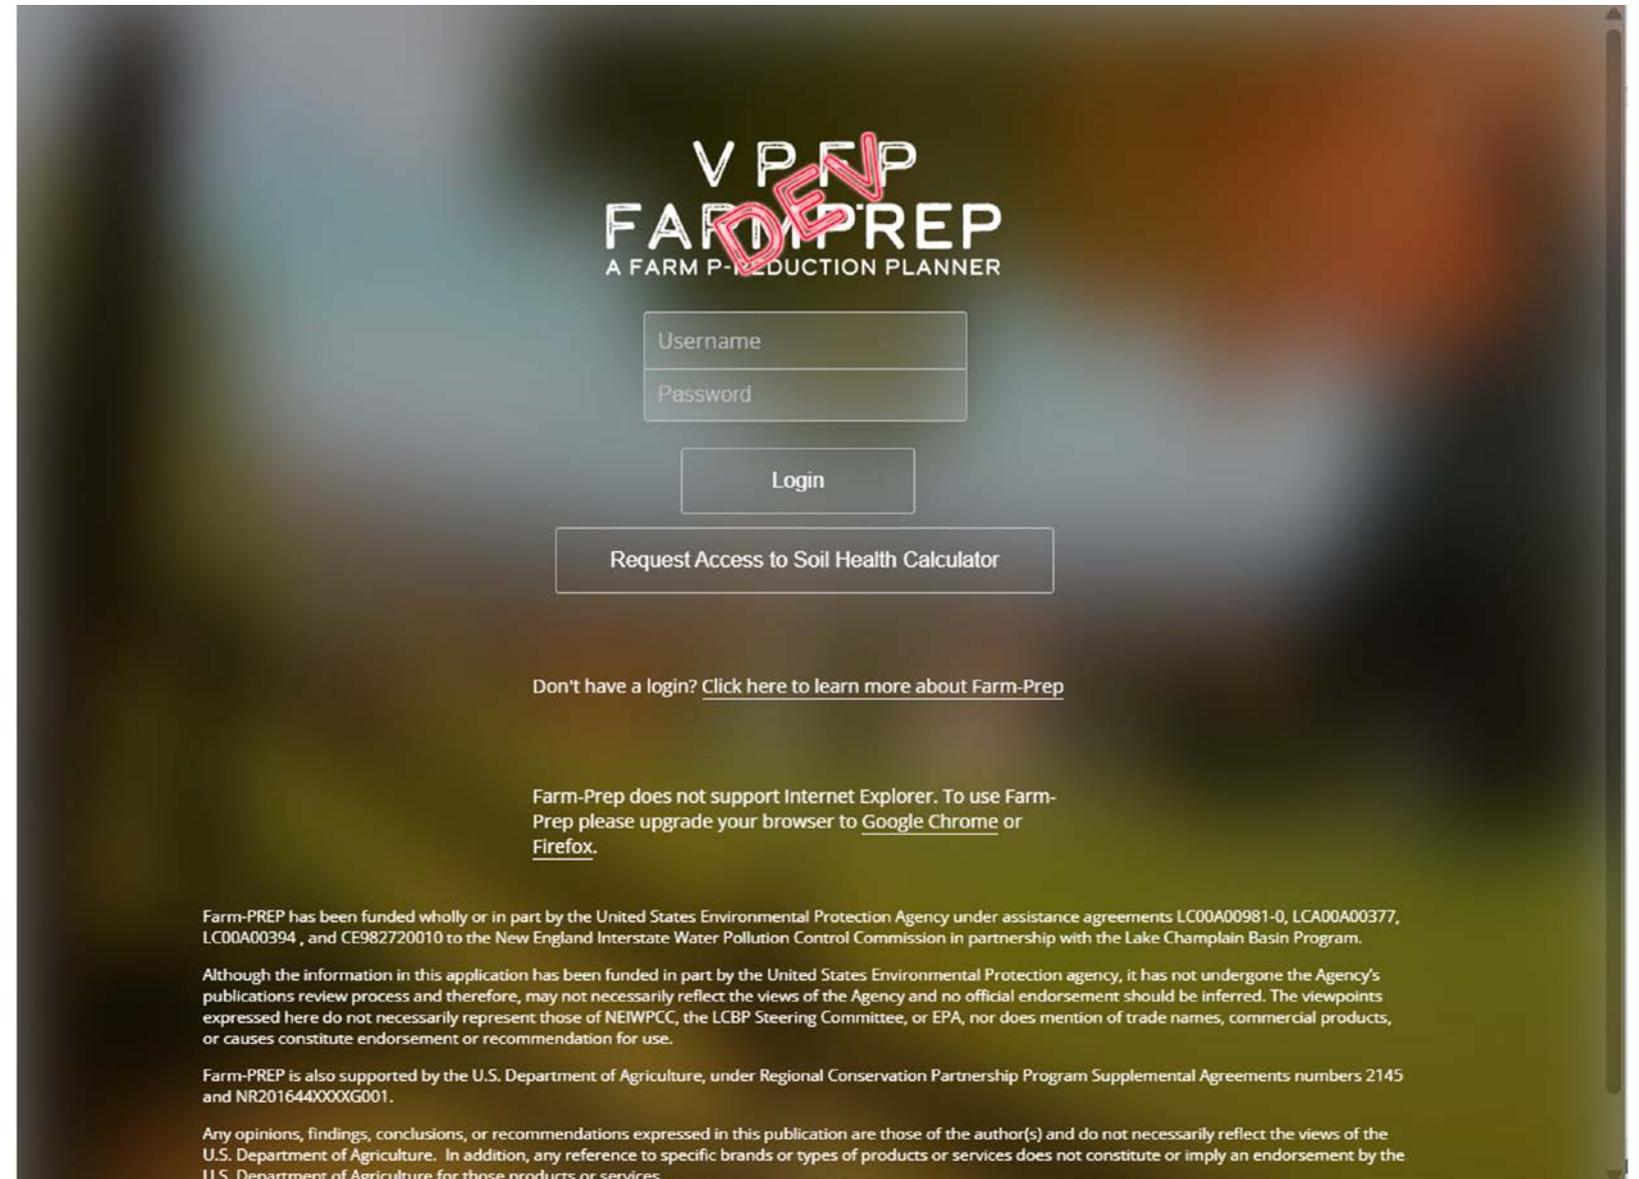

Figure 1: Percentage of field acreage, percentage of phosphorus loss, and percentage of payment by current phosphorus loss levels (lb/ac). Fields with lower phosphorus loss levels represent a lower percentage of total phosphorus loss (lb) and a higher percentage of payment.

Tool Development: Farm-PREP Functionality

Data entry:

- Pulls soil and weather data for fields.
- Creates APEX management inputs from dynamic drop-down options.
- Conservation practice implementation options.
- Customized data entry workflows
 - Streamlined for public users
 - Additional requirements for programmatic use
 - Verification/review
 - Coordination with other tools in Vermont (goCrop, Nutrient Management Plans, etc.)
 - Uploads for farms with large numbers of fields

Tool Development: Farm-PREP Assessments

Planned/Actual Assessments

Assess user specified (current) management against a spatially explicit baseline management

Baseline representative of TMDL modeling

Used to calculate performance-based and stewardship payments

Pay for Performance users

Practice Assessments

Tool creates alternative practice-based management for all included fields

Baseline is current management

Shows users predicted impact of practices on all included fields (where applicable)

All users

Optimization Assessments

Tool creates and tests various configurations of practices on included fields to meet user specified farm-scale reduction of phosphorus

Baseline is no practice scenario

Shows users first 10 management configurations that achieve desired reduction (within 5% threshold)

User can prioritize or exclude practices

All users

Model Development: How do we 'calibrate' the tool?

APEX, as with many process-based models, has many inputs and requires calibration/validation.

Two categories of inputs into APEX when we run from Farm-PREP:

- Site-specific
 - in Farm-PREP these are acquired from publicly available datasets (e.g., SSURGO, NOAA land station weather time series) and user inputs
 - these contribute to expected variability across fields
- 'Global' parameters
 - these apply to all fields simulated in the tool
 - dictate which algorithms are used to estimate certain processes and coefficients/parameter values for certain equations.

Global parameter set requires calibration/validation to observed data.

Source: Stone Environmental, Inc.

Model Development: Multi-Objective Calibration, Observed Data

Data Type	Number of data points (mostly reflects data-years)	Number of sites
Runoff	34	9
Erosion	32	8
Soluble Phosphorus Loss	30	7
Sediment Phosphorus Loss	25	6
Total Phosphorus Loss	29	8
Soluble Nitrogen Loss	22	5
Sediment Nitrogen Loss	22	5
Total Nitrogen Loss	25	6
Tile Drain Flow	24	8
Tile Drain Phosphorus	14	7
Tile Drain Nitrogen	14	7
Crop Yield	51	7
Net Ecosystem Production	4	4
Carbon Dioxide	18	8
Nitrous Oxide	22	12
Carbon Stocks	6	6
Soil Nitrogen	6	6
Soil Respiration	52	8
Soil Organic Carbon	52	8
Total	482	32

Data used for model evaluation:

- Site specific comparisons (outputs in table, management known, location or physical characteristics known)

Model Development: Multi-Objective Calibration, Observed Data (2)

Data used for model evaluation:

- Site specific comparisons (outputs in table, management known, location or physical characteristics known)
- Larger standardized datasets to compare to lots of hypothetical model runs

Model Development: Batch Simulations, Comparison to Observed Results

Soil organic matter (SOM): Primary driver of carbon storage and impacts the physical, biological, and chemical properties of soil.

The range of values for SOM is similar between modeled and measured datasets, with model results bracketing the observed.

APEX predicted SOM is lower than SSHVT measured SOM while predicted OM is generally a bit higher than VLTHS measured OM, largely due to simulated management.

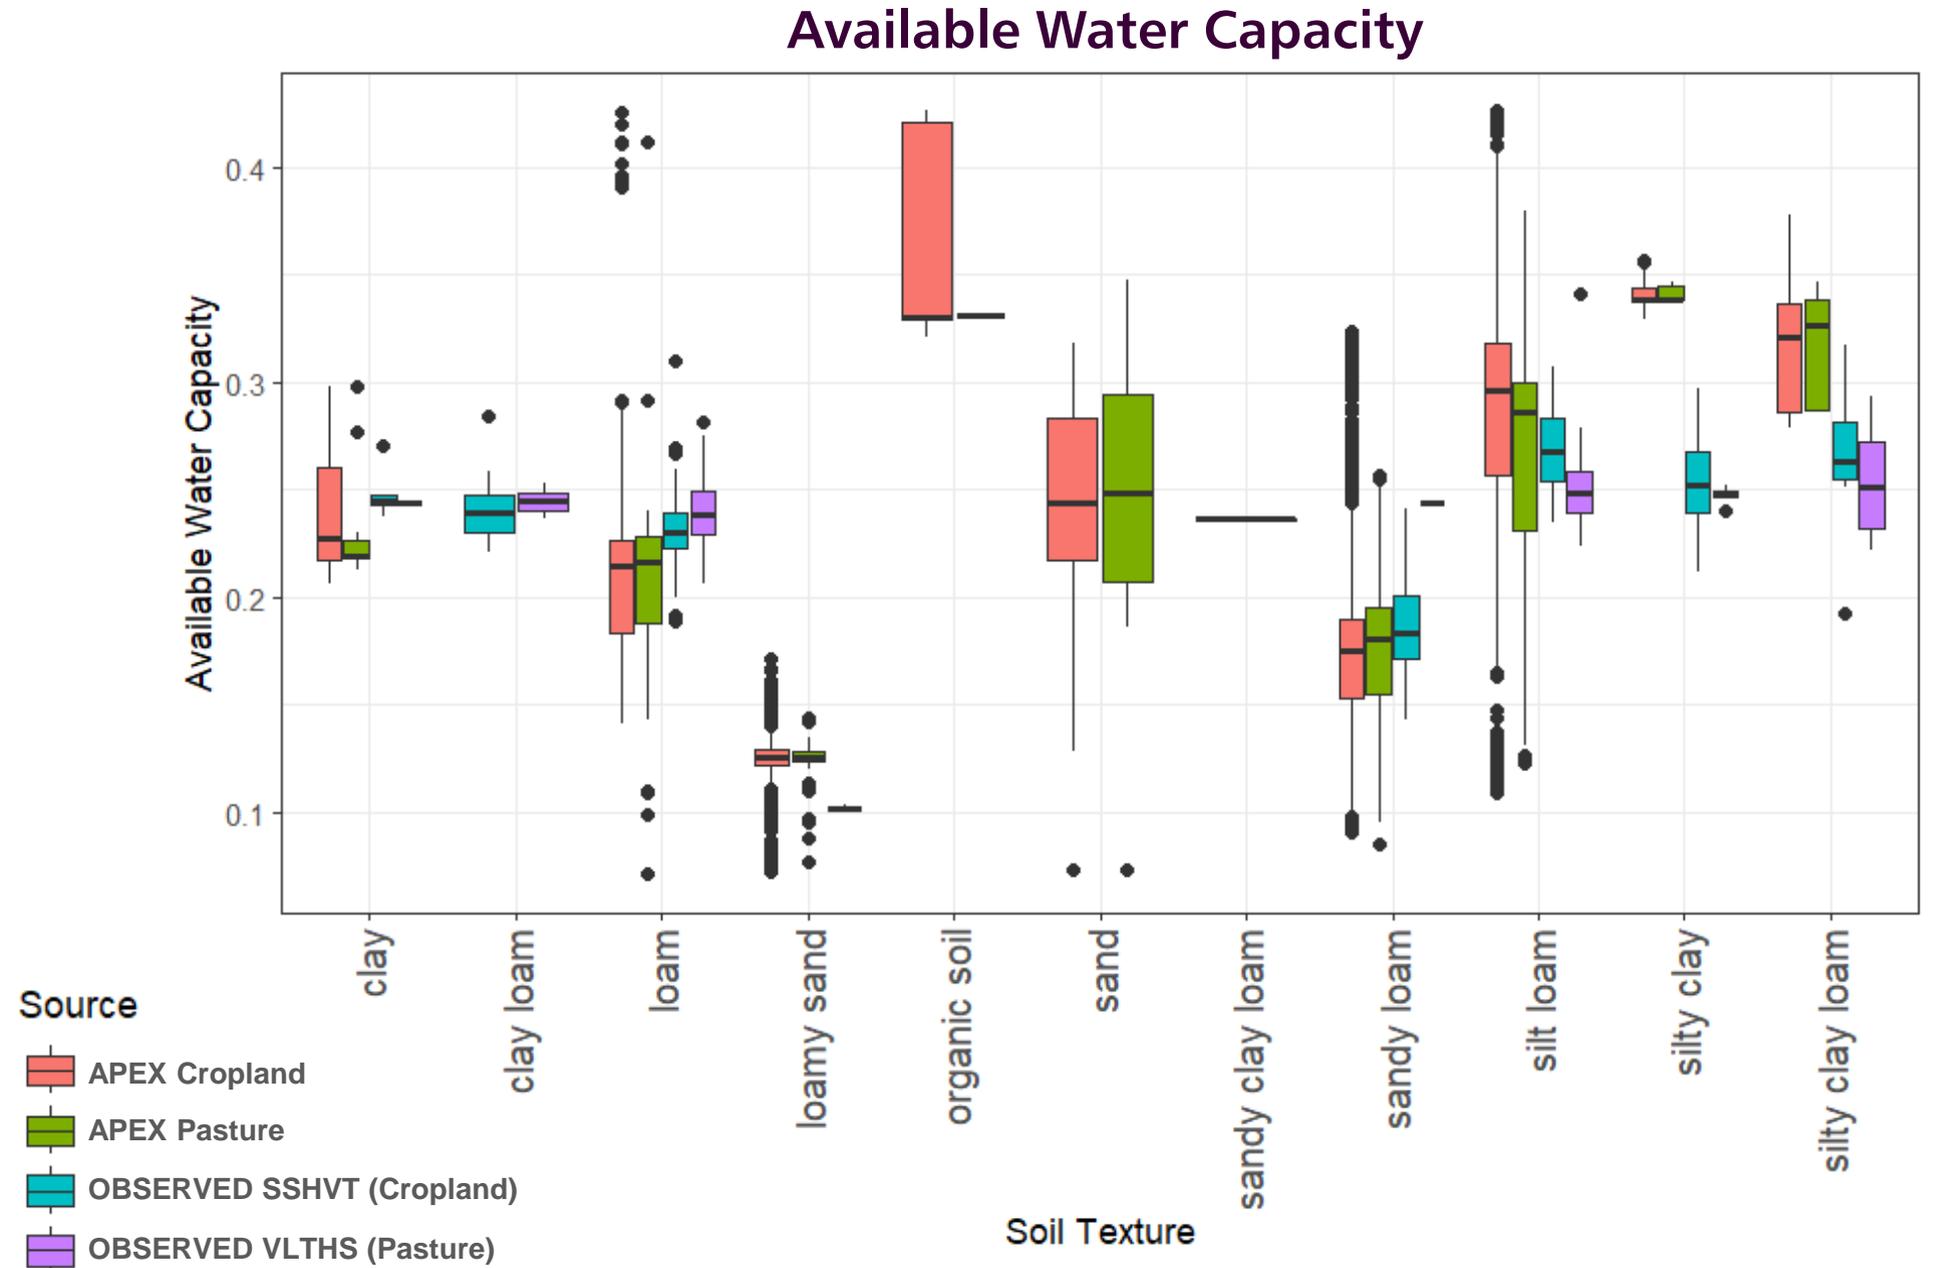

Model Development: Batch Simulations, Comparison to Observed Results (2)

Available water capacity (AWC): related to porosity and represents the amount of water stored in the soil that is available for plant uptake.

Calculated with APEX as the difference between field capacity and wilting point (dynamic).

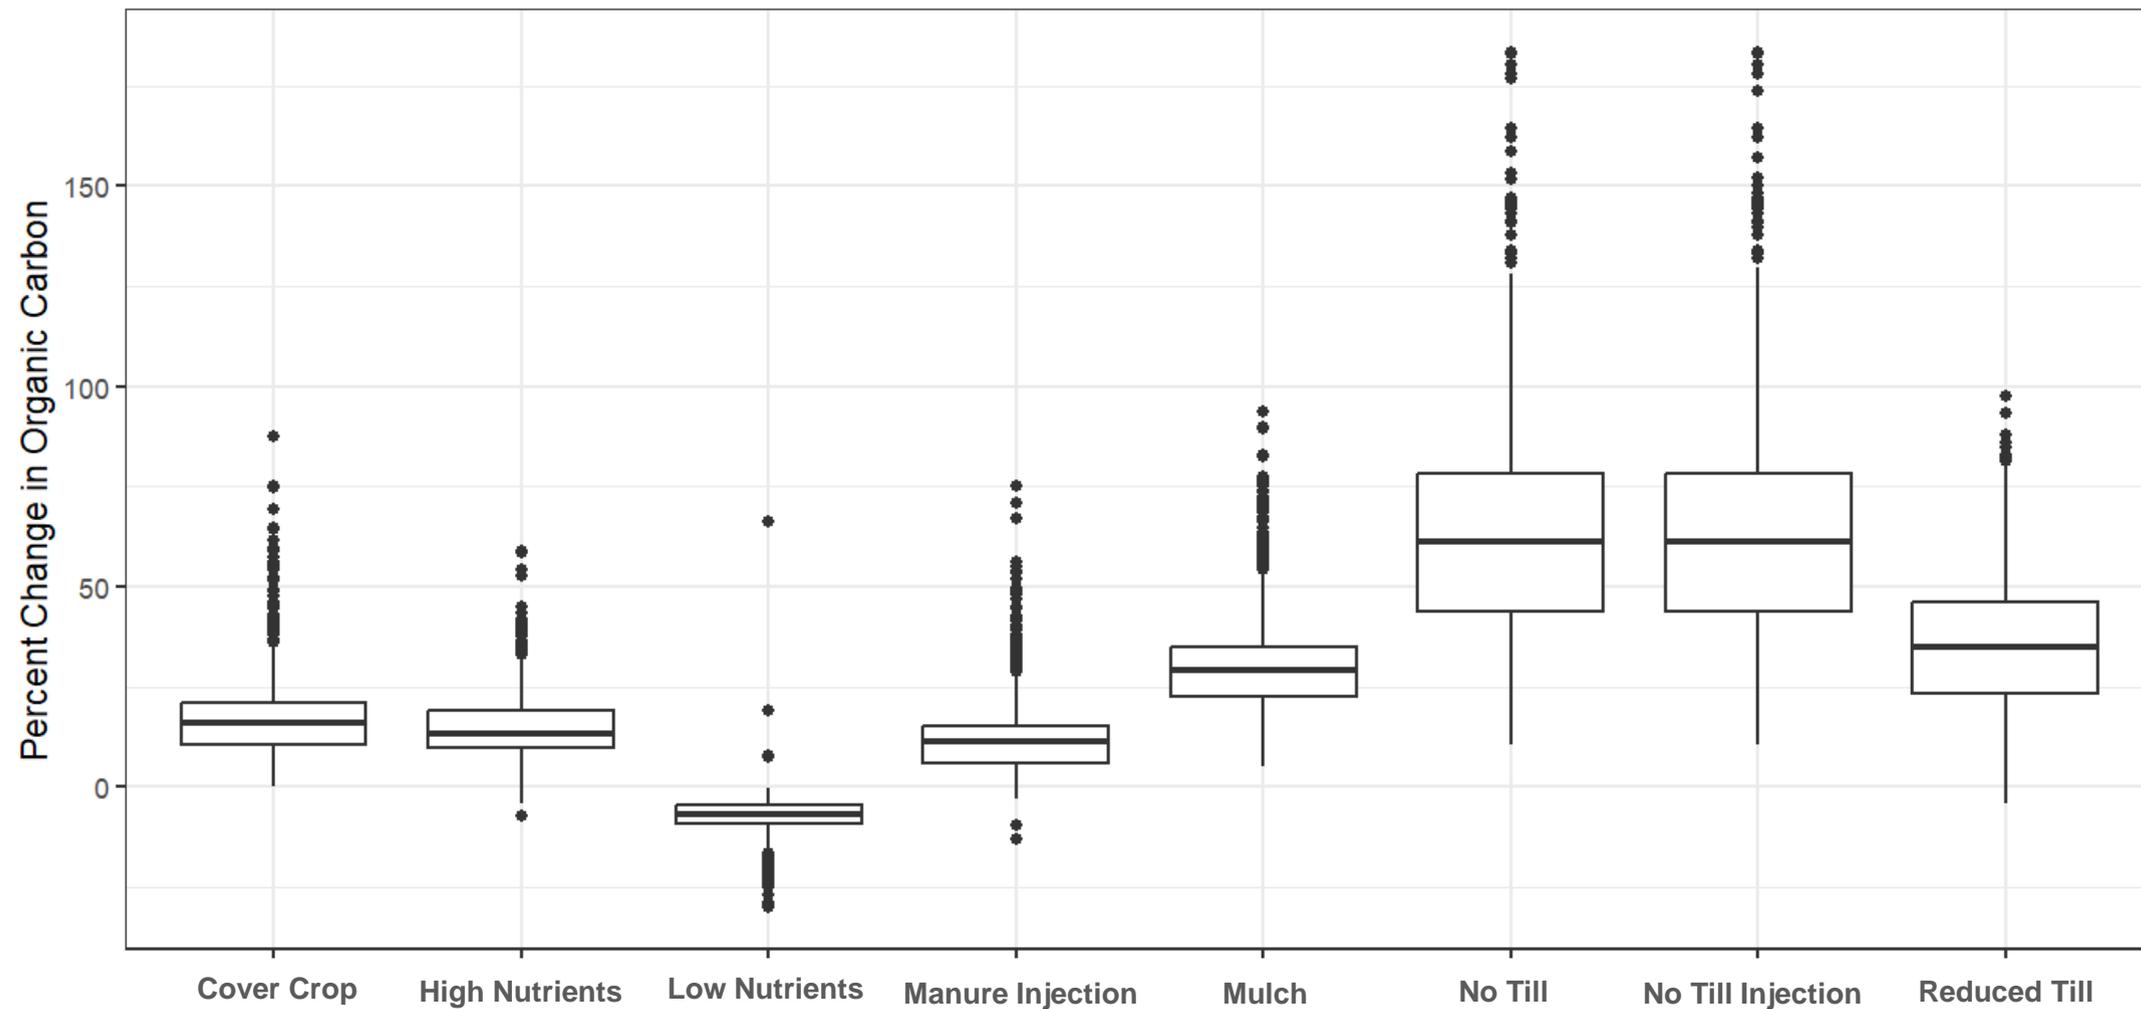

There is strong agreement between modeled and measured AWC in both cropland and pasture soil.

Model Development: Batch Simulations, Management Trends

Soil Organic Carbon/Matter – 15 cm

All practice scenarios except low nutrients result in higher modeled annual average percent soil organic carbon. This is consistent with research that has demonstrated that cover crops increase SOC and that long-term no till systems increase SOM.

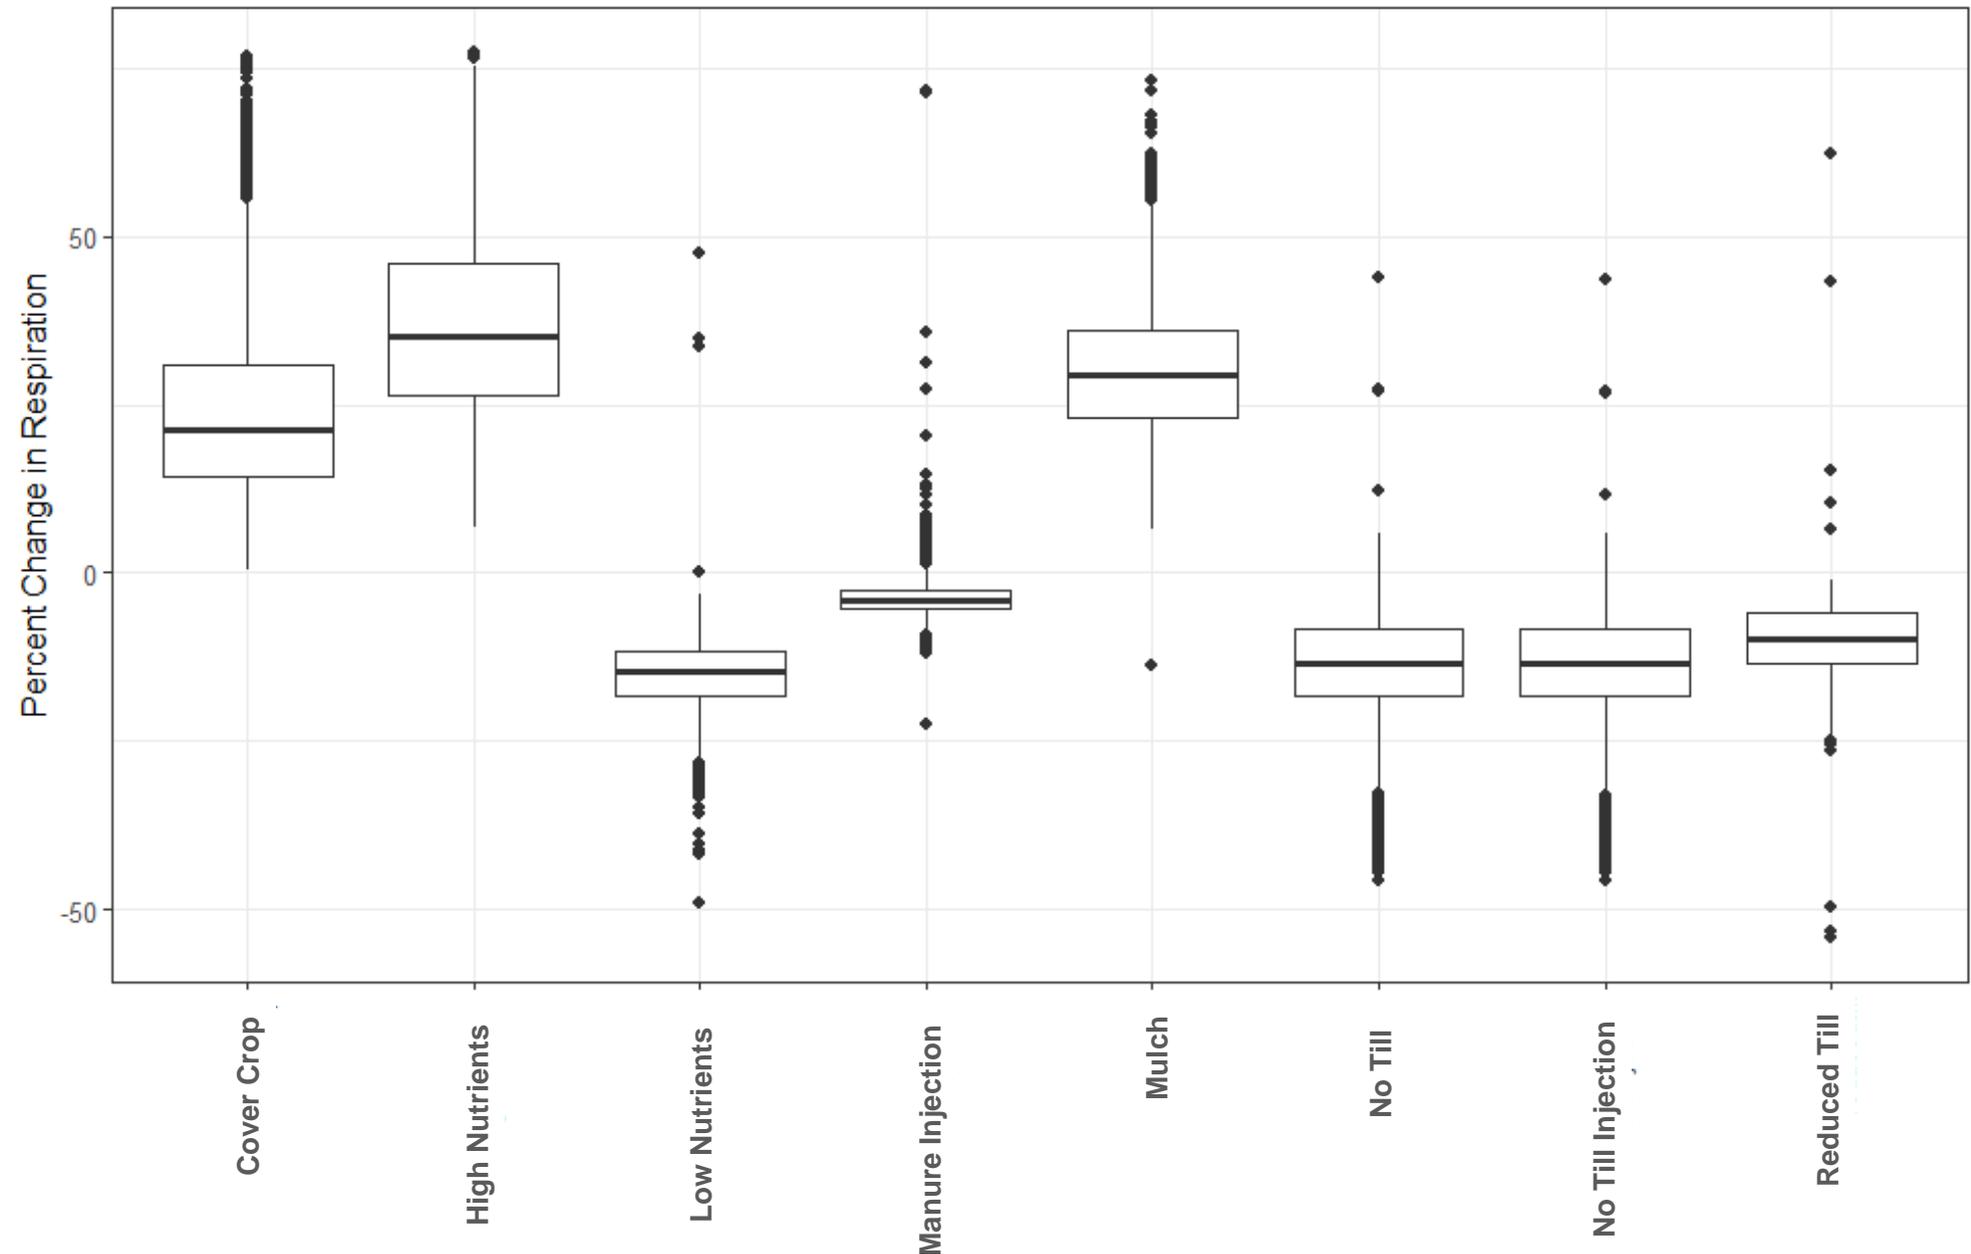

Model Development: Batch Simulations, Management Trends (2)

Respiration

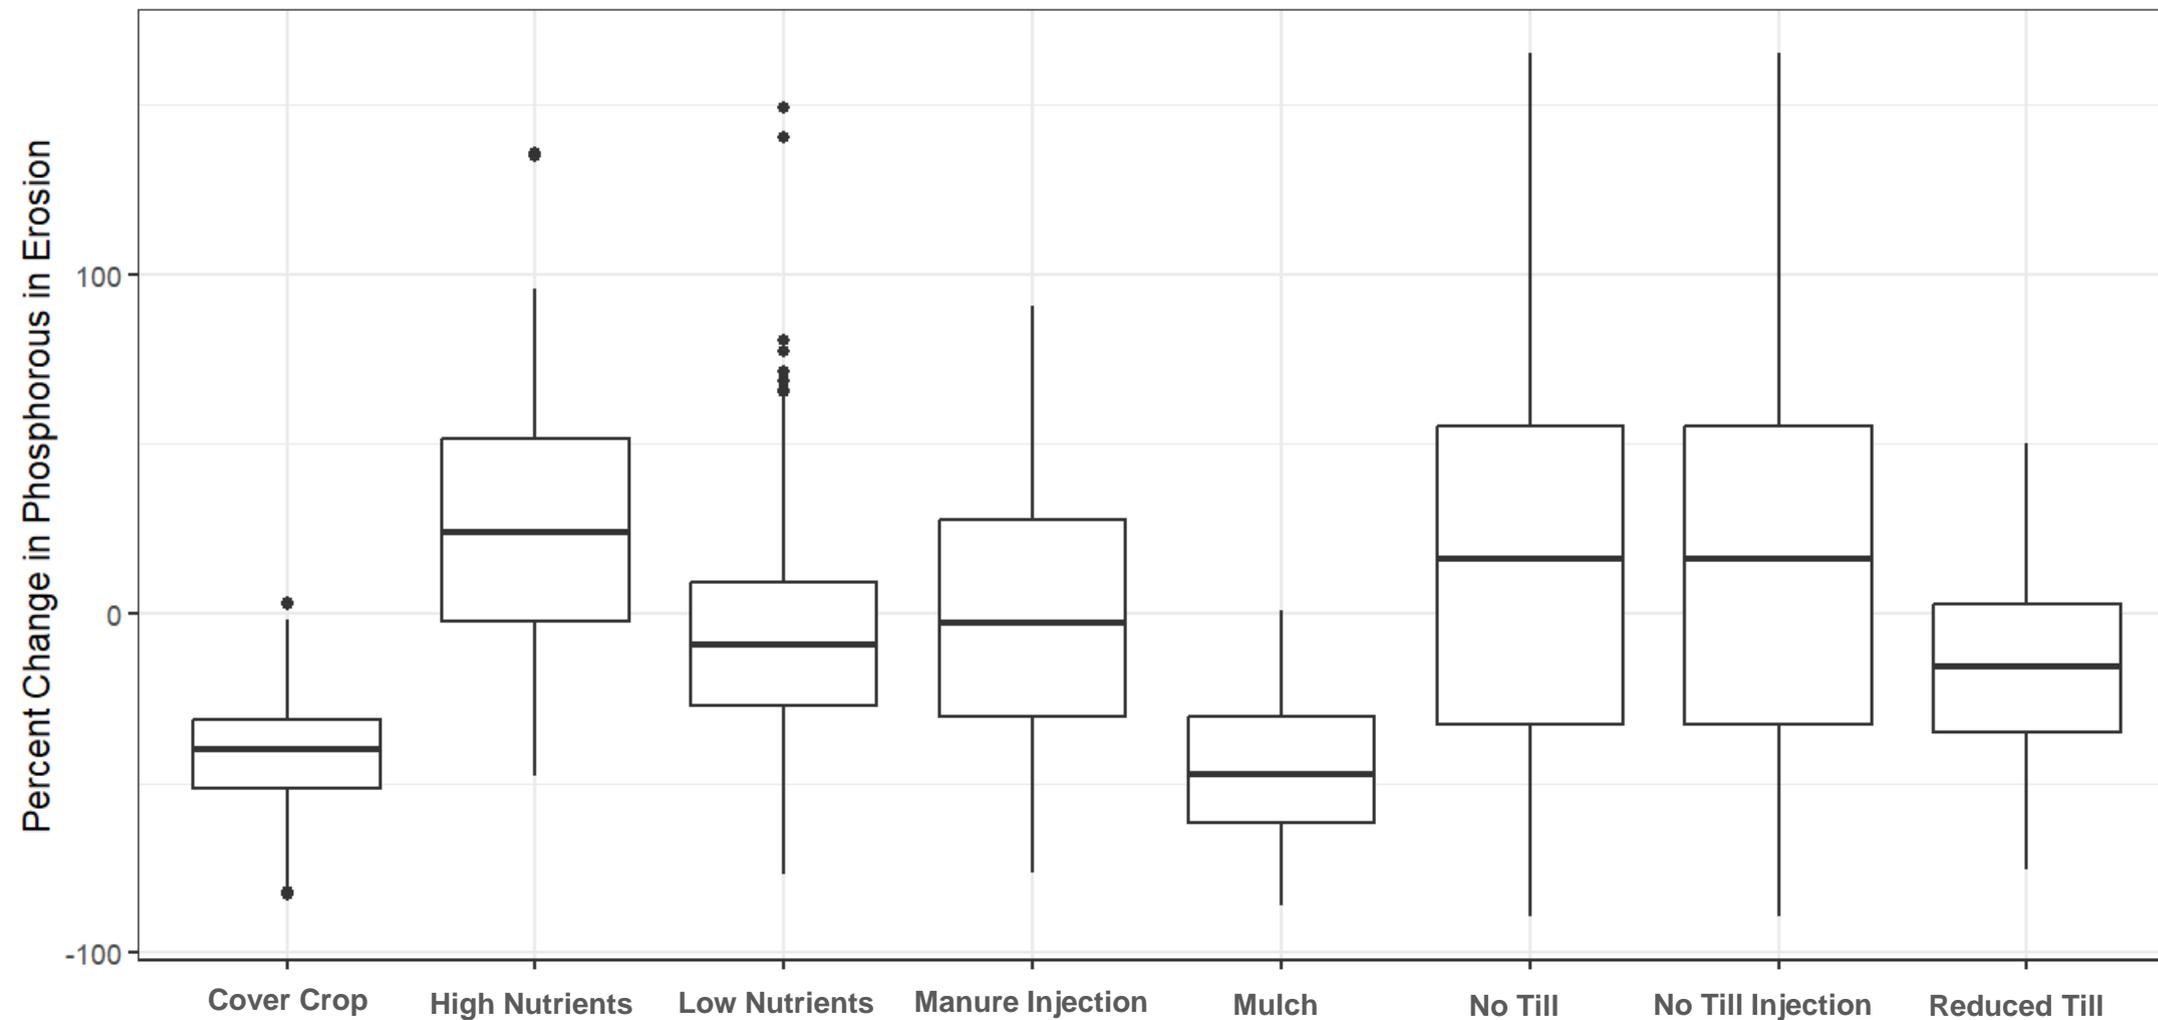

No-till and reduced tillage systems generally increase soil moisture and surface residue, both of which lower soil temperatures. These factors reduce aeration, slow microbial decomposition, and therefore soil respiration.

Other practices that increase available nutrients like mulching and high nutrient inputs also represent additional carbon inputs, favoring plant root growth by providing additional C and N, and increasing respiration.

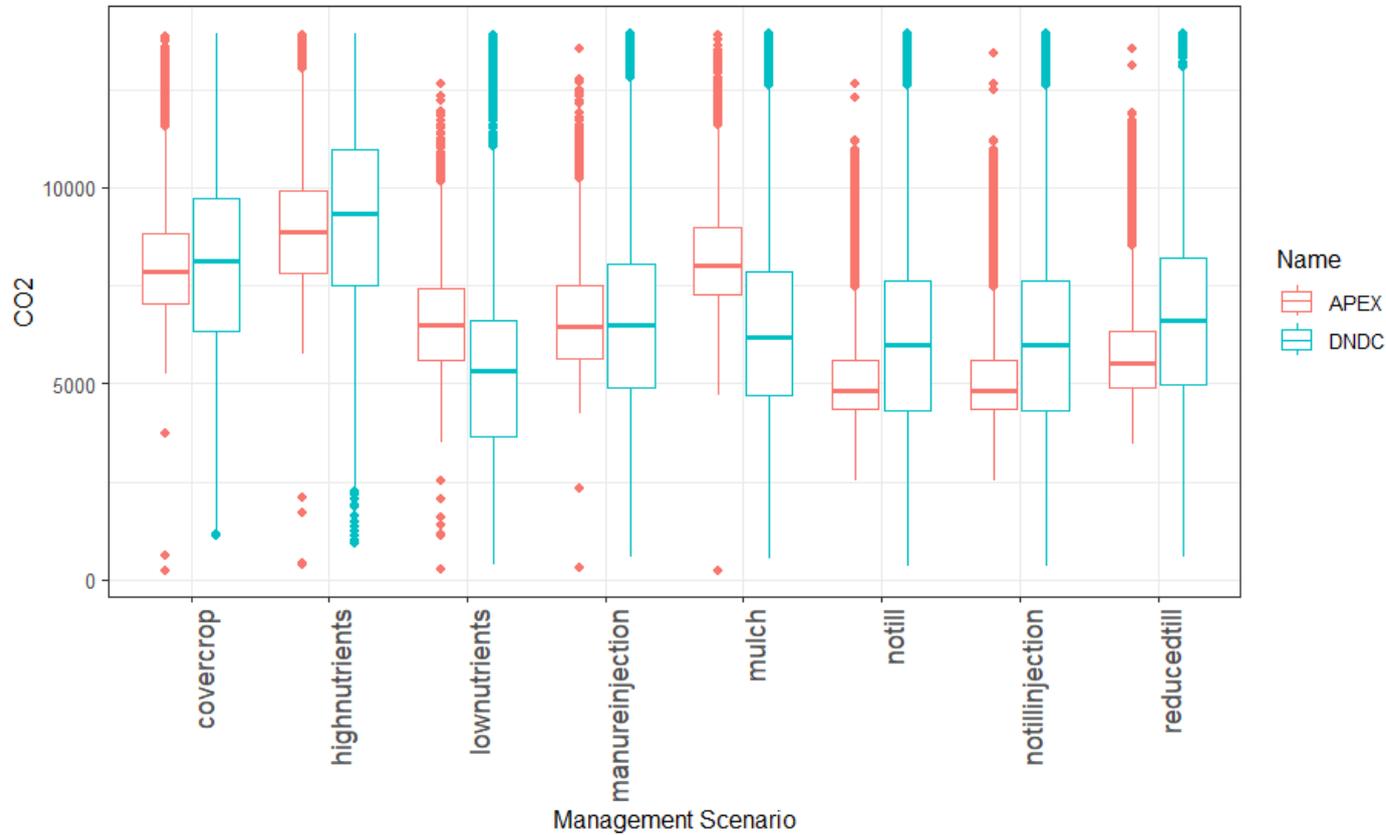

Model Development: Batch Simulations, Management Trends (3)

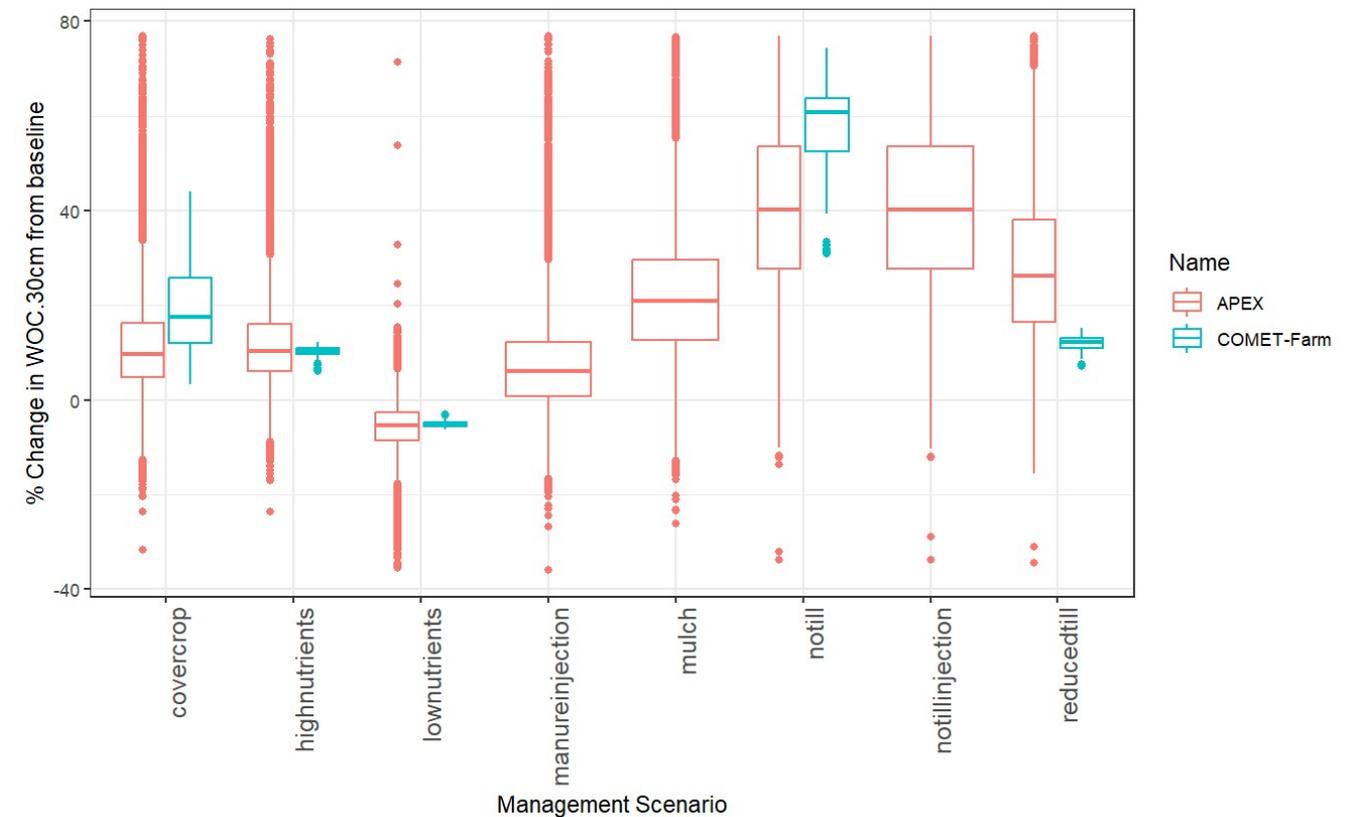

Sediment-driven phosphorous loss declines with cover cropping, lower nutrient inputs, mulching, and reduced tillage due to reduced erosion and lower near surface soil phosphorus concentrations.

Model Development: Greenhouse Gas Comparison, Preliminary

Comparing COMET-Farm and DNDC to APEX results for outputs and scenarios we can harmonize, predictions generally show decent agreement.

Are predicted values from different models similar?

Do different models respond similarly to simulated management?

Modeling Results: Sustainability Metrics

Soil Health

- Bulk density
- Soil organic matter
- Respiration
- Active carbon
- Peak soluble P in soil
- Plant available water capacity

Crop Metrics

- Crop nitrogen stress
- Crop phosphorus stress
- Yields
- Total nitrogen applied
- Total phosphorus applied

Greenhouse Gases

- CO₂ Flux
- N₂O Flux
- Gross GHG Emissions
- Carbon Sequestered in Soil
- Soil Carbon Stocks

Surface Losses

- Precipitation
- Runoff
- Erosion
- Nitrogen surface losses
- Phosphorus surface losses
- Nitrogen volatilization

Reporting is focused on annual average (or average growing season) values over 30-year simulation.

Also report change in soil organic matter and change in bulk density from start to end of simulations.

Can report on inter-annual variability.

Modeling Results: Farm-PREP Example Assessments

Welcome jstryker | [CHANGE PASSWORD](#) | [ABOUT FARM-PREP](#) | [LOGOUT](#)

Field List
[Upload Fields](#) [Draw Field](#)

All fields must be added before running an assessment. All crop and hay fields managed by the farm must be added for assessment for VFPF. Field shapefiles can be uploaded or drawn directly in FarmPREP. Field names must be unique and exactly match the field names of any data to be imported, i.e. field shapefiles or soil tests.

Take-aways: Our goal

Increased adoption of agricultural management practices that enhance and/or maintain healthy soils, reduce greenhouse gas emissions and sequester carbon, reduce nutrient and pesticide losses, and meet the agronomic needs of farmers through customized scenario analysis.

Source: Drilled cover crops in Waterford VT
(<https://vermontbiz.com/news/2023/january/05/vermont-pay-performance-program-application-now-open-farms>).

Take aways: Where are we?

We established a robust global APEX calibration for modeling multiple processes and output metrics on agricultural fields VT

Trends in environmental responses to management practice changes align with our expected behavior across a broad range of metrics

Tillage and nutrient inputs are a primary driver across most metrics, but land use and other practices/factors also have an impact

Our updated APEX modeling approach and calibration are implemented in Farm-PREP, providing a more holistic quantification of the environmental benefits to changes in farm management

Source: <https://cedarcirclefarm.org/tips/entry/no-till-agriculture>

Take aways: Future work and opportunities

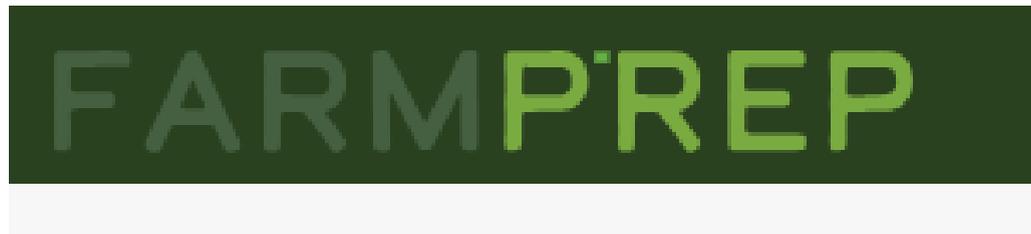

Continue to work with Vermont Agency of Agriculture on Pay for Performance 2.0

- Improve comparison tool for even better communication of outcomes and decision support
- Additional outreach and training
- Continue to evaluate APEX modeling for greenhouse gases and working lands (e.g. forest)

Alternative baselines (relative field vulnerability, or other)

Build climate change scenarios into the tool

Customization and additions ... for pesticides, national scale, user workflows, 'talking' to other tools, ...
